

## Construction, Field Services & Training

FMC Technologies offers complete supervision and monitoring of equipment installation from delivery through start-up and commissioning on all of our product lines.

Our experienced field engineers provide on-site, comprehensive instructions to system installers, ensuring smooth installation. Hands-on training is also offered for operating and maintenance personnel. All construction work is performed by highly-qualified, customer-approved subcontractors.

Our field representatives are available to offer a full range of field services including site analysis and equipment inspections to ensure peak performance of your equipment, whether it was supplied by FMC Technologies, or by others. Recommendations can be made for upgrading or improving performance of more mature facilities.

If your needs require additional on-site involvement or single source responsibility for field construction, FMC Technologies offers services from construction management to full turnkey responsibilities including, complete installation, start-up, and commissioning.

These services extend to after-market support, such as, conveyor “walk-downs,” where one of our technicians performs a complete inspection of critical system components and their performance, then documents findings in an easy-to-read report. Critical components include: belt condition, belt tracking, idlers, cleaners, and many more.

**We put you first.  
And keep you ahead.**
